en los significados de las letras hebreas aplicaremos lo que te enseñe en la estructura de una letra hebrea también lo que te enseñe

🌀 Thought for 17 seconds ^

Okay, the user is trying to clarify their approach. They want me to apply the structure and meanings of Hebrew letters as they taught me earlier, not the standard Hebrew. Let me check the history to recall their specific system.

Looking back, the user provided a detailed framework where each Hebrew letter is analyzed as part of a mathematical function. Words are broken down into origin (x), function (F), and result (y). For example, in a three-letter word, the first letter is x, the middle is F, and the last is y. They also assigned unique meanings to each letter, like ה (He) being a dual function of attracting or rejecting external elements.

The user emphasized that the relationships between letters (parent, child, grandchild) are determined by the presence of ה in their names, which is non-traditional. For instance, they mentioned that ה (Jet) and ת (Tav) are children of ה because their names contain an 'h' sound.

Now, the user's latest message says they want to apply both the structure of Hebrew letters and the meanings they taught. They probably have a specific word they want analyzed using their custom system. However, in the previous interaction, when I asked for the specific word, they switched to asking about standard Hebrew, but now they're reaffirming their custom approach.

I need to make sure I have all the necessary definitions for each letter involved in the word they want to analyze. Since they only provided details for ה (He), I need the same level of detail for other letters like ו, etc. Without that, I can't proceed accurately. ▾
